

Short Answer Type Questions

1. For a positive integer n , find the value of $(1+i)^n \left(1 - \frac{1}{i}\right)^n$.

Sol. $(1+i)^n \left(1 - \frac{1}{i}\right)^n = (1+i)^n \left(1 - \frac{i}{i^2}\right)^n = (1+i)^n (1+i)^n = (1-i^2)^n = 2^n$

2. Evaluate $\sum_{n=1}^{13} (i^n + i^{n+1})$, where $n \in N$.

Sol.
$$\begin{aligned} \sum_{n=1}^{13} (i^n + i^{n+1}) &= \sum_{n=1}^{13} (1+i)i^n \\ &= (1+i)(i + i^2 + i^3 + i^4 + i^5 + i^6 + i^7 + i^8 + i^9 + i^{10} + i^{11} + i^{12} + i^{13}) \\ &= (1+i)(i - 1 - i + 1 + i - 1 - i + 1 + i - 1 - i + 1 + i) \\ &= (1+i)i = i + i^2 = i - 1 \end{aligned}$$

Alternative method:

$$\begin{aligned} \sum_{n=1}^{13} (i^n + i^{n+1}) &= \sum_{n=1}^{13} (1+i)i^n \\ &= (1+i)(i + i^2 + i^3 + i^4 + i^5 + i^6 + i^7 + i^8 + i^9 + i^{10} + i^{11} + i^{12} + i^{13}) \\ &= (1+i) \frac{i(i^{13}-1)}{i-1} = (1+i) \frac{i(i-1)}{i-1} = (1+i)i = i + i^2 = i - 1 \end{aligned}$$

3. If $\left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = x + iy$, then find (x, y) .

Sol. $x + iy = \left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3$

$$= \left(\frac{(1+i)^2}{1-i^2}\right)^3 - \left(\frac{(1-i)^2}{1-i^2}\right)^3 = \left(\frac{1+2i+i^2}{1+1}\right)^3 - \left(\frac{1-2i+i^2}{1+1}\right)^3$$

$$= \left(\frac{2i}{2}\right)^3 - \left(\frac{-2i}{2}\right)^3 = i^3 - (-i^3) = 2i^3 = 0 - 2i$$

$\Rightarrow x = 0$ and $y = -2$

4. If $\frac{(1+i)^2}{2-i} = x + iy$, then find the value of $x + y$.

Sol. $x + iy = \frac{(1+i)^2}{2-i} = \frac{1+2i+i^2}{2-i} = \frac{2i}{2-i} = \frac{2i(2+i)}{(2-i)(2+i)} = \frac{4i+2i^2}{4-i^2}$

$$= \frac{4i-2}{4+1} = \frac{-2}{5} + \frac{4i}{5}$$

$\Rightarrow x = \frac{-2}{5}, y = \frac{4}{5} \Rightarrow x + y = \frac{-2}{5} + \frac{4}{5} = \frac{2}{5}$

5. If $\left(\frac{1-i}{1+i}\right)^{100} = a + ib$, then find (a, b) .

Sol. $a + ib = \left(\frac{1-i}{1+i}\right)^{100} = \left[\frac{(1-i)}{(1+i)} \cdot \frac{(1-i)}{(1-i)}\right]^{100} = \left[\frac{(1-i)^2}{1-i^2}\right]^{100}$

$$= \left(\frac{1-2i+i^2}{1+1}\right)^{100} = \left(\frac{-2i}{2}\right)^{100} = (i^4)^{25} = 1$$

$\therefore (a, b) = (1, 0)$

Q6. If $a = \cos \theta + i \sin \theta$, then find the value of $(1+a/1-a)$

Sol: $a = \cos \theta + i \sin \theta$

$$\begin{aligned} \therefore \frac{1+a}{1-a} &= \frac{(1+\cos\theta) + i\sin\theta}{(1-\cos\theta) - i\sin\theta} \\ &= \frac{2\cos^2\frac{\theta}{2} + i2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}{2\sin^2\frac{\theta}{2} - i2\sin\frac{\theta}{2}\cos\frac{\theta}{2}} = \frac{2\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right)}{2\sin\frac{\theta}{2}\left(\sin\frac{\theta}{2} - i\cos\frac{\theta}{2}\right)} \\ &= \frac{i\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right)}{\sin\frac{\theta}{2}\left(i\sin\frac{\theta}{2} - i^2\cos\frac{\theta}{2}\right)} = \frac{i\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right)}{\sin\frac{\theta}{2}\left(i\sin\frac{\theta}{2} + \cos\frac{\theta}{2}\right)} = i\cot\frac{\theta}{2} \end{aligned}$$

7. If $(1+i)z = (1-i)\bar{z}$, then show that $z = -i\bar{z}$.

Sol. We have, $(1+i)z = (1-i)\bar{z}$

$$\Rightarrow z = \frac{1-i}{1+i}\bar{z} = \frac{(1-i)(1-i)}{(1+i)(1-i)}\bar{z} = \frac{(1-i)^2}{(1-i^2)}\bar{z} = \frac{1-2i+i^2}{1+1}\bar{z} = \frac{1-2i-1}{2}\bar{z} = -i\bar{z}$$

8. If $z = x + iy$, then show that $z\bar{z} + 2(z + \bar{z}) + b = 0$, where $b \in R$, represents a circle.

Sol. Given that, $z = x + iy \Rightarrow \bar{z} = x - iy$

$$\text{Now, } z\bar{z} + 2(z + \bar{z}) + b = 0$$

$$\Rightarrow (x + iy)(x - iy) + 2(x + iy + x - iy) + b = 0$$

$$\Rightarrow x^2 + y^2 + 4x + b = 0; \text{ this is the equation of a circle}$$

9. If the real part of $\frac{\bar{z} + 2}{\bar{z} - 1}$ is 4, then show that the locus of the point representing z in the complex plane is a circle.

Sol. Let $z = x + iy$

$$\begin{aligned} \text{Now, } \frac{\bar{z} + 2}{\bar{z} - 1} &= \frac{x - iy + 2}{x - iy - 1} = \frac{[(x+2) - iy][(x-1) + iy]}{[(x-1) - iy][(x-1) + iy]} \\ &= \frac{(x-1)(x+2) + y^2 + i[(x+2)y - (x-1)y]}{(x-1)^2 + y^2} \end{aligned}$$

Given that real part is 4.

$$\Rightarrow \frac{(x-1)(x+2) + y^2}{(x-1)^2 + y^2} = 4 \Rightarrow x^2 + x - 2 + y^2 = 4(x^2 - 2x + 1 + y^2)$$

$$\Rightarrow 3x^2 + 3y^2 - 9x + 6 = 0, \text{ which represents a circle.}$$

Hence, locus of z is circle

Q10. Show that the complex number z , satisfying the condition $\arg(z-1/z+1) = \pi/4$ lies on a circle.

Sol: Let $z = x + iy$

$$\text{Given that, } \arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{4}$$

$$\Rightarrow \arg(z-1) - \arg(z+1) = \pi/4$$

$$\Rightarrow \arg(x+iy-1) - \arg(x+iy+1) = \pi/4$$

$$\Rightarrow \arg(x-1+iy) - \arg(x+1+iy) = \pi/4$$

$$\Rightarrow \tan^{-1} \frac{y}{x-1} + \tan^{-1} \frac{y}{x+1} = \frac{\pi}{4} \Rightarrow \tan^{-1} \left[\frac{\frac{y}{x-1} - \frac{y}{x+1}}{1 + \left(\frac{y}{x-1}\right)\left(\frac{y}{x+1}\right)} \right] = \frac{\pi}{4}$$

$$\Rightarrow \frac{y(x+1-x+1)}{x^2-1+y^2} = \tan \frac{\pi}{4} \Rightarrow \frac{2y}{x^2+y^2-1} = 1$$

$$\Rightarrow x^2+y^2-1 = 2y$$

$$\Rightarrow x^2+y^2-2y-1 = 0, \text{ which represents a circle.}$$

Q11. Solve the equation $|z| = z + 1 + 2i$.

Sol: We have $|z| = z + 1 + 2i$

Putting $z = x + iy$, we get

$$|x + iy| = x + iy + 1 + 2i$$

$$\Rightarrow \sqrt{x^2 + y^2} = (x+1) + i(y+2) \quad [\because |z| = \sqrt{x^2 + y^2}]$$

Comparing real and imaginary parts, we get

$$\sqrt{x^2 + y^2} = x + 1;$$

$$\text{And } 0 = y + 2 \Rightarrow y = -2$$

Putting this value of y in $\sqrt{x^2 + y^2} = x + 1$, we get

$$x^2 + (-2)^2 = (x+1)^2$$

$$\Rightarrow x^2 + 4 = x^2 + 2x + 1 \quad \Rightarrow x = 3/2$$

$$\therefore z = x + iy = 3/2 - 2i$$

Long Answer Type Questions

Q12. If $|z + 1| = z + 2(1 + i)$, then find the value of z .

Sol: We have $|z + 1| = z + 2(1 + i)$

Putting $z = x + iy$, we get

$$\text{Then, } |x + iy + 1| = x + iy + 2(1 + i)$$

$$\Rightarrow |x + iy + 1| = x + iy + 2(1 + i)$$

Comparing real and imaginary parts, we get

$$\sqrt{(x+1)^2 + y^2} = x+2;$$

And $y+2=0 \Rightarrow y=-2$

Putting $y=-2$ into $\sqrt{(x+1)^2 + y^2} = x+2$, we get

$$(x+1)^2 + (-2)^2 = (x+2)^2$$

$$\Rightarrow x^2 + 2x + 1 + 4 = x^2 + 4x + 4 \quad \Rightarrow 2x = 1 \quad \Rightarrow x = \frac{1}{2}$$

$$\therefore z = x + iy = \frac{1}{2} - 2i$$

Q13. If $\arg(z-1) = \arg(z+3i)$, then find $(x-1) : y$, where $z = x + iy$.

Sol: We have $\arg(z-1) = \arg(z+3i)$, where $z = x + iy$

$$\Rightarrow \arg(x + iy - 1) = \arg(x + iy + 3i)$$

$$\Rightarrow \arg(x-1 + iy) = \arg[x + i(y+3)]$$

$$\Rightarrow \tan^{-1} \frac{y}{x-1} = \tan^{-1} \frac{y+3}{x} \Rightarrow \frac{y}{x-1} = \frac{y+3}{x}$$

$$\Rightarrow xy = (x-1)(y+3)$$

$$\Rightarrow xy = xy - y + 3x - 3 \quad \Rightarrow 3x - 3 = y$$

$$\Rightarrow \frac{x-1}{y} = \frac{1}{3}$$

$$\therefore (x-1) : y = 1 : 3$$

Q14. Show that $|z-2/z-3| = 2$ represents a circle. Find its center and radius.

Sol: We have $|z-2/z-3| = 2$

Putting $z = x + iy$, we get

$$\left| \frac{x + iy - 2}{x + iy - 3} \right| = 2$$

$$\Rightarrow |x - 2 + iy| = 2|x - 3 + iy| \Rightarrow \sqrt{(x-2)^2 + y^2} = 2\sqrt{(x-3)^2 + y^2}$$

$$\Rightarrow x^2 - 4x + 4 + y^2 = 4(x^2 - 6x + 9 + y^2) \Rightarrow 3x^2 + 3y^2 - 20x + 32 = 0$$

$$\Rightarrow x^2 + y^2 - \frac{20}{3}x + \frac{32}{3} = 0 \Rightarrow \left(x - \frac{10}{3}\right)^2 + y^2 + \frac{32}{3} - \frac{100}{9} = 0$$

$$\Rightarrow \left(x - \frac{10}{3}\right)^2 + (y - 0)^2 = \frac{4}{9}$$

Hence, centre of the circle is $\left(\frac{10}{3}, 0\right)$ and radius is $\frac{2}{3}$.

Q15. If $z-1/z+1$ is a purely imaginary number ($z \neq -1$), then find the value of $|z|$.

Sol: Let $z = x + iy$

$$\begin{aligned} \Rightarrow \frac{z-1}{z+1} &= \frac{x+iy-1}{x+iy+1}, z \neq -1 \\ &= \frac{x-1+iy}{x+1+iy} = \frac{(x-1+iy)(x+1-iy)}{(x+1+iy)(x+1-iy)} \\ &= \frac{(x^2-1) + y^2 + i[y(x+1) - y(x-1)]}{(x+1)^2 + y^2} \end{aligned}$$

It is given that $\frac{z-1}{z+1}$ is a purely imaginary.

$$\Rightarrow \frac{(x^2-1) + y^2}{(x+1)^2 + y^2} = 0 \quad \Rightarrow x^2 - 1 + y^2 = 0 \quad \Rightarrow x^2 + y^2 = 1$$

$$\Rightarrow \sqrt{x^2 + y^2} = 1$$

$$\Rightarrow |z| = 1$$

Alternative method:

Since $\frac{z-1}{z+1}$ is a purely imaginary number, we have

$$\frac{z-1}{z+1} + \overline{\left(\frac{z-1}{z+1}\right)} = 0$$

$$\Rightarrow \frac{z-1}{z+1} + \frac{\bar{z}-1}{\bar{z}+1} = 0 \Rightarrow \frac{(z-1)(\bar{z}+1) + (z+1)(\bar{z}-1)}{(z+1)(\bar{z}+1)} = 0$$

$$\Rightarrow z\bar{z} + z - \bar{z} - 1 + z\bar{z} - z + \bar{z} - 1 = 0 \Rightarrow 2z\bar{z} - 2 = 0$$

$$\Rightarrow |z|^2 - 1 = 0$$

$$\Rightarrow |z| = 1$$

16. z_1 and z_2 are two complex numbers such that $|z_1| = |z_2|$ and $\arg(z_1) + \arg(z_2) = \pi$, then show that $z_1 = -\bar{z}_2$.

Sol. Let $z_1 = |z_1|(\cos \theta_1 + i \sin \theta_1)$ and $z_2 = |z_2|(\cos \theta_2 + i \sin \theta_2)$

Given that, $|z_1| = |z_2|$

And $\arg(z_1) + \arg(z_2) = \pi$

$$\Rightarrow \theta_1 + \theta_2 = \pi \quad \Rightarrow \theta_1 = \pi - \theta_2$$

Now, $z_1 = |z_2|[\cos(\pi - \theta_2) + i \sin(\pi - \theta_2)]$

$$\Rightarrow z_1 = |z_2|(-\cos \theta_2 + i \sin \theta_2) \Rightarrow z_1 = -|z_2|(\cos \theta_2 - i \sin \theta_2)$$

$$\Rightarrow z_1 = -[|z_2|(\cos \theta_2 - i \sin \theta_2)] \quad \Rightarrow z_1 = -\bar{z}_2$$

Q17. If $|z_1| = 1$ ($z_1 \neq -1$) and $z_2 = z_1 - \frac{1}{z_1} + 1$, then show that real part of z_2 is zero.

Sol. Let $z_1 = x + iy$

$$\Rightarrow |z_1| = \sqrt{x^2 + y^2} = 1 \text{ (given)}$$

$$\begin{aligned} \text{Now, } z_2 &= \frac{z_1 - 1}{z_1 + 1} \\ &= \frac{x + iy - 1}{x + iy + 1} = \frac{x - 1 + iy}{x + 1 + iy} \\ &= \frac{(x - 1 + iy)(x + 1 - iy)}{(x + 1 + iy)(x + 1 - iy)} \\ &= \frac{(x^2 - 1) + y^2 + i[y(x + 1) - y(x - 1)]}{(x + 1)^2 + y^2} \\ &= \frac{x^2 + y^2 - 1 + 2iy}{(x + 1)^2 + y^2} = \frac{1 - 1 + 2iy}{(x + 1)^2 + y^2} \quad [\because x^2 + y^2 = 1] \\ &= 0 + \frac{2yi}{(x + 1)^2 + y^2} \end{aligned}$$

Hence, the real part of z_2 is zero.

Q18. If Z_1, Z_2 and Z_3, Z_4 are two pairs of conjugate complex numbers, then find $\arg(Z_1/Z_4) + \arg(Z_2/Z_3)$

Sol. It is given that z_1 and z_2 are conjugate complex numbers.

$$\Rightarrow z_2 = \bar{z}_1$$

Also, z_3 and z_4 are conjugate complex numbers.

$$\Rightarrow z_4 = \bar{z}_3$$

$$\begin{aligned} \text{Now, } \arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right) &= \arg\left(\frac{z_1}{z_4}\right)\left(\frac{z_2}{z_3}\right) \\ &= \arg\left(\frac{z_1}{\bar{z}_3}\right)\left(\frac{\bar{z}_1}{z_3}\right) = \arg\left(\frac{z_1\bar{z}_1}{z_3\bar{z}_3}\right) \\ &= \arg\left(\frac{|z_1|^2}{|z_3|^2}\right) = 0 \quad \left(\because \frac{|z_1|^2}{|z_3|^2} \text{ is purely real}\right) \end{aligned}$$

19. If $|z_1| = |z_2| = \dots = |z_n| = 1$, then show that $|z_1 + z_2 + z_3 + \dots + z_n|$

$$= \left| \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} + \dots + \frac{1}{z_n} \right|$$

Sol. Given that $|z_1| = |z_2| = \dots = |z_n| = 1$

$$\Rightarrow |z_1|^2 = |z_2|^2 = \dots = |z_n|^2 = 1$$

$$\Rightarrow z_1\bar{z}_1 = z_2\bar{z}_2 = z_3\bar{z}_3 = \dots = z_n\bar{z}_n = 1$$

$$\Rightarrow z_1 = \frac{1}{\bar{z}_1}, z_2 = \frac{1}{\bar{z}_2}, \dots, z_n = \frac{1}{\bar{z}_n}$$

Now, $|z_1 + z_2 + z_3 + z_4 + \dots + z_n|$

$$\begin{aligned} &= \left| \frac{z_1\bar{z}_1}{\bar{z}_1} + \frac{z_2\bar{z}_2}{\bar{z}_2} + \frac{z_3\bar{z}_3}{\bar{z}_3} + \dots + \frac{z_n\bar{z}_n}{\bar{z}_n} \right| = \left| \frac{1}{\bar{z}_1} + \frac{1}{\bar{z}_2} + \frac{1}{\bar{z}_3} + \dots + \frac{1}{\bar{z}_n} \right| \\ &= \left| \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} + \dots + \frac{1}{z_n} \right| = \left| \frac{1}{z_1} + \frac{1}{z_2} + \dots + \frac{1}{z_n} \right| \end{aligned}$$

Q20. If for complex number z_1 and z_2 , $\arg(z_1) - \arg(z_2) = 0$, then show that $|z_1 - z_2| = |z_1| - |z_2|$

Sol. Let $z_1 = |z_1| (\cos \theta_1 + i \sin \theta_1)$ and $z_2 = |z_2| (\cos \theta_2 + i \sin \theta_2)$

$$\Rightarrow \arg(z_1) = \theta_1 \text{ and } \arg(z_2) = \theta_2$$

It is given that

$$\arg(z_1) - \arg(z_2) = 0$$

$$\Rightarrow \theta_1 - \theta_2 = 0 \quad \Rightarrow \theta_1 = \theta_2$$

Now, $z_2 = |z_2| (\cos \theta_1 + i \sin \theta_1)$ [$\because \theta_1 = \theta_2$]

$$\text{So, } z_1 - z_2 = (|z_1| \cos \theta_1 - |z_2| \cos \theta_1) + i (|z_1| \sin \theta_1 - |z_2| \sin \theta_1)$$

$$\begin{aligned} \Rightarrow |z_1 - z_2| &= \sqrt{(|z_1| \cos \theta_1 - |z_2| \cos \theta_1)^2 + (|z_1| \sin \theta_1 - |z_2| \sin \theta_1)^2} \\ &= \sqrt{|z_1|^2 + |z_2|^2 - 2|z_1||z_2| \cos^2 \theta_1 - 2|z_1||z_2| \sin^2 \theta_1} \\ &= \sqrt{|z_1|^2 + |z_2|^2 - 2|z_1||z_2| [\cos^2 \theta_1 + \sin^2 \theta_1]} \\ &= \sqrt{|z_1|^2 + |z_2|^2 - 2|z_1||z_2|} = \sqrt{(|z_1| - |z_2|)^2} \end{aligned}$$

$$\Rightarrow |z_1 - z_2| = |z_1| - |z_2|$$

Alternative method:

Let $A(z_1)$ and $B(z_2)$ be on the Argand plane.

It is given that $\arg(z_1) = \arg(z_2)$.

So, A and B lie on the same ray emanating from origin O .

So, points O, A and B are collinear.

$$\Rightarrow AB = OA - OB \quad (\text{Assuming } |z_1| > |z_2|)$$

$$\Rightarrow |z_1 - z_2| = |z_1| - |z_2|$$

Q21. Solve the system of equations $\text{Re}(z^2) = 0, |z| = 2$.

Sol: Given that, $\text{Re}(z^2) = 0$, $|z| = 2$

Let $z = x + iy$. Then $|z| = \sqrt{x^2 + y^2}$.

Given that $\sqrt{x^2 + y^2} = 2$

$$\Rightarrow x^2 + y^2 = 4 \quad \dots(i)$$

Also, $z^2 = x^2 + 2ixy - y^2 = (x^2 - y^2) + 2ixy$

Now, $\text{Re}(z^2) = 0$

$$\Rightarrow x^2 - y^2 = 0 \quad (ii)$$

Solving (i) and (ii), we get

$$\Rightarrow x^2 = y^2 = 2$$

$$\Rightarrow x = \pm\sqrt{2} \text{ and } y = \pm\sqrt{2}$$

$$\therefore z = x + iy = \pm\sqrt{2} \pm i\sqrt{2}$$

Hence, we have four complex numbers.

Q22. Find the complex number satisfying the equation $z + \sqrt{2}|(z + 1)| + i = 0$.

Sol. We have $z + \sqrt{2}|(z + 1)| + i = 0 \quad \dots(i)$

Putting $z = x + iy$, we get

$$x + iy + \sqrt{2}|x + iy + 1| + i = 0$$

$$\Rightarrow x + i(1 + y) + \sqrt{2}[\sqrt{(x+1)^2 + y^2}] = 0$$

$$\Rightarrow x + i(1 + y) + \sqrt{2}\sqrt{(x^2 + 2x + 1 + y^2)} = 0$$

Comparing real and imaginary parts to zero, we get

$$x + \sqrt{2}\sqrt{x^2 + 2x + 1 + y^2} = 0 \quad (ii)$$

$$\text{And } y + 1 = 0 \Rightarrow y = -1$$

Putting $y = -1$ into (ii), we get

$$x + \sqrt{2}\sqrt{x^2 + 2x + 1 + 1} = 0$$

$$\Rightarrow \sqrt{2}\sqrt{x^2 + 2x + 2} = -x$$

$$\Rightarrow 2x^2 + 4x + 4 = x^2 \Rightarrow x^2 + 4x + 4 = 0 \Rightarrow (x + 2)^2 = 0$$

$$\Rightarrow x = -2$$

$$\therefore z = x + iy = -2 - i$$

23. Write the complex number $z = \frac{1-i}{\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}}$ in polar form.

Sol.
$$z = \frac{1-i}{\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}}$$

$$= \frac{\sqrt{2} \left[\frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right]}{\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}} = \frac{\sqrt{2} \left[\cos \left(-\frac{\pi}{4} \right) + i \sin \left(-\frac{\pi}{4} \right) \right]}{\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}}$$

$$= \sqrt{2} \left[\cos \left(-\frac{\pi}{4} - \frac{\pi}{3} \right) + i \sin \left(-\frac{\pi}{4} - \frac{\pi}{3} \right) \right]$$

$$= \sqrt{2} \left[\cos \left(-\frac{7\pi}{12} \right) + i \sin \left(-\frac{7\pi}{12} \right) \right]$$

$$= -\sqrt{2} \left[\cos \frac{5\pi}{12} + i \sin \frac{5\pi}{12} \right]$$

24. If z and w are two complex numbers such that $|zw| = 1$ and $\arg(z) - \arg(w) = \frac{\pi}{2}$, then show that $\bar{z}w = -i$.

Sol. Let $z = |z|(\cos \theta_1 + i \sin \theta_1)$ and $w = |w|(\cos \theta_2 + i \sin \theta_2)$

Given that, $|zw| = |z||w| = 1$

Also, $\arg(z) - \arg(w) = \frac{\pi}{2} \Rightarrow \theta_1 - \theta_2 = \frac{\pi}{2}$

Now, $\bar{z}w = |z|(\cos \theta_1 - i \sin \theta_1) |w|(\cos \theta_2 + i \sin \theta_2)$
 $= |z||w|(\cos(-\theta_1) + i \sin(-\theta_1))(\cos \theta_2 + i \sin \theta_2)$
 $= 1[\cos(\theta_2 - \theta_1) + i \sin(\theta_2 - \theta_1)] = [\cos(-\pi/2) + i \sin(-\pi/2)]$
 $= 1[0 - i] = -i$

Fill in the blanks

25. Fill in the blanks of the following

- (i) For any two complex numbers z_1, z_2 and any real numbers a, b ,
 $|az_1 - bz_2|^2 + |bz_1 + az_2|^2 = \underline{\hspace{2cm}}$.
- (ii) The value of $\sqrt{-25} \times \sqrt{-9}$ is $\underline{\hspace{2cm}}$.
- (iii) The number $\frac{(1-i)^3}{1-i^3}$ is equal to $\underline{\hspace{2cm}}$.
- (iv) The sum of the series $i + i^2 + i^3 + \dots$ upto 1000 terms is $\underline{\hspace{2cm}}$.
- (v) Multiplicative inverse of $1 + i$ is $\underline{\hspace{2cm}}$.
- (vi) If z_1 and z_2 are complex numbers such that $z_1 + z_2$ is a real number, then
 $z_1 = \underline{\hspace{2cm}}$.
- (vii) $\arg(z) + \arg(\bar{z})$ where, $(\bar{z} \neq 0)$ is $\underline{\hspace{2cm}}$.
- (viii) If $|z + 4| \leq 3$, then the greatest and least values of $|z + 1|$ are $\underline{\hspace{2cm}}$ and
 $\underline{\hspace{2cm}}$.
- (ix) If $\left| \frac{z-2}{z+2} \right| = \frac{\pi}{6}$, then the locus of z is $\underline{\hspace{2cm}}$.
- (x) If $|z| = 4$ and $\arg(z) = \frac{5\pi}{6}$, then $z = \underline{\hspace{2cm}}$.

- Sol.** (i) $|az_1 - bz_2|^2 + |bz_1 + az_2|^2$
 $= |az_1|^2 + |bz_2|^2 - 2\text{Re}(az_1 \times b\bar{z}_2) + |bz_1|^2 + |az_2|^2 + 2\text{Re}(bz_1 \times a\bar{z}_2)$
 $= (a^2 + b^2)|z_1|^2 + (a^2 + b^2)|z_2|^2 = (a^2 + b^2)(|z_1|^2 + |z_2|^2)$
- (ii) $\sqrt{-25} \times \sqrt{-9} = i\sqrt{25} \times i\sqrt{9} = i^2(5 \times 3) = -15$
- (iii) $\frac{(1-i)^3}{1-i^3} = \frac{(1-i)^3}{(1-i)(1+i+i^2)} = \frac{(1-i)^2}{i} = \frac{1+i^2-2i}{i} = \frac{-2i}{i} = -2$
- (iv) $i + i^2 + i^3 + \dots$ upto 1000 terms
 $= (i + i^2 + i^3 + i^4) + (i^5 + i^6 + i^7 + i^8) + \dots$ 250 brackets
 $= 0 + 0 + 0 \dots + 0 \quad [\because i^n + i^{n+1} + i^{n+2} + i^{n+3} = 0, \text{ where } n \in N]$
- (v) Multiplicative inverse of $1 + i = \frac{1}{1+i} = \frac{1-i}{1-i^2} = \frac{1-i}{2}(1-i)$
- (vi) Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$
 $z_1 + z_2 = (x_1 + x_2) + i(y_1 + y_2)$, which is real
 $\Rightarrow y_1 + y_2 = 0 \Rightarrow y_1 = -y_2$
 $\therefore z_2 = x_1 - iy_1 \quad [\text{Assuming } x_1 = x_2]$
 $\Rightarrow z_2 = \bar{z}_1$
- (vii) $\arg(z) + \arg(\bar{z}) = \theta + (-\theta) = 0$
- (viii) Given that, $|z + 4| \leq 3$
 For the greatest value of $|z + 1|$,

$$|z + 1| = |z + 4 - 3| = 2$$

$$|z + 1| = |z + 4 - 3|$$

$$\text{or } |z + 1| \leq |z + 4| + |-3|$$

$$\text{or } |z + 1| \leq 3 + 3$$

$$\text{or } |z + 1| \leq 6$$

So, greatest value of $|z + 1|$ is 6.

We know that the least value of the modulus of a complex number is zero.

So, the least value of $|z + 1|$ is zero.

$$(ix) \text{ We have } \left| \frac{z - 2}{z + 2} \right| = \frac{\pi}{6}$$

$$\Rightarrow \frac{|x + iy - 2|}{|x + iy + 2|} = \frac{\pi}{6} \Rightarrow \frac{|x - 2 + iy|}{|x + 2 + iy|} = \frac{\pi}{6}$$

$$\Rightarrow 6|x - 2 + iy| = \pi|x + 2 + iy| \Rightarrow 36|x - 2 + iy|^2 = \pi^2|x + 2 + iy|^2$$

$$\Rightarrow 36[x^2 - 4x + 4 + y^2] = \pi^2[x^2 + 4x + 4 + y^2]$$

$$\Rightarrow (36 - \pi^2)x^2 + (36 - \pi^2)y^2 - (144 + 4\pi^2)x + 144 - 4\pi^2 = 0, \text{ which is a circle.}$$

$$(x) \text{ Let } z = |z|(\cos \theta + i \sin \theta)$$

Where $\theta = \arg(z)$

$$\text{Given that } |z| = 4 \text{ and } \arg(z) = \frac{5\pi}{6}$$

$$\Rightarrow z = 4 \left[\cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6} \right] \quad (z \text{ lies in II quadrant})$$

$$= 4 \left[-\frac{\sqrt{3}}{2} + i \frac{1}{2} \right] = -2\sqrt{3} + 2i$$

True/False Type Questions

Q26. State true or false for the following.

(i) The order relation is defined on the set of complex numbers.

(ii) Multiplication of a non-zero complex number by $-i$ rotates the point about origin through a right angle in the anti-clockwise direction.

(iii) For any complex number z , the minimum value of $|z| + |z - 11|$ is 1.

(iv) The locus represented by $|z - 11| = |z - i|$ is a line perpendicular to the join of the points $(1,0)$ and $(0, 1)$.

(v) If z is a complex number such that $z \neq 0$ and $\operatorname{Re}(z) = 0$, then $\operatorname{Im}(z^2) = 0$.

(vi) The inequality $|z - 4| < |z - 2|$ represents the region given by $x > 3$.

(vii) Let Z_1 and Z_2 be two complex numbers such that $|z + z_2| = |z_1| + |z_2|$, then $\arg(z_1 - z_2) = 0$.

(viii) 2 is not a complex number.

Sol:(i) False

We can compare two complex numbers when they are purely real. Otherwise comparison of complex numbers is not possible or has no meaning.

(ii) False

Let $z = x + iy$, where $x, y > 0$

i.e., z or point $A(x, y)$ lies in first quadrant. Now, $-iz = -i(x + iy)$

$$= -ix - i^2y = y - ix$$

Now, point $B(y, -x)$ lies in fourth quadrant. Also, $\angle AOB = 90^\circ$

Thus, B is obtained by rotating A in clockwise direction about origin.

(iii) **True**

$$|z| + |z - 1|$$

We know that $|z_1| + |z_2| \geq |z_1 - z_2|$

$$\Rightarrow |z| + |z - 1| \geq |z - (z - 1)| \Rightarrow |z| + |z - 1| \geq 1$$

So, minimum value of $|z| + |z - 1|$ is 1.

Alternative method:

Let $A(z)$ and $B(1)$.

$$\Rightarrow |z| + |z - 1| = OA + AB, \text{ where } O \text{ is origin}$$

From triangular inequality, we get

$$OA + AB \geq OB$$

$$\Rightarrow (OA + AB)_{\min} = OB = 1$$

(iv) **True**

We have, $|z - 1| = |z - i|$

Putting $z = x + iy$, we get

$$\Rightarrow |x - 1 + iy| = |x - i(1 - y)|$$

$$\Rightarrow (x - 1)^2 + y^2 = x^2 + (1 - y)^2 \Rightarrow x^2 - 2x + 1 + y^2 = x^2 + 1 + y^2 - 2y$$

$$\Rightarrow -2x + 1 = 1 - 2y \quad \Rightarrow -2x + 2y = 0 \quad \Rightarrow x - y = 0$$

Now, equation of a line through the points $(1, 0)$ and $(0, 1)$ is:

$$y - 0 = \frac{1 - 0}{0 - 1}(x - 1)$$

$$\text{or } x + y = 1$$

This line is perpendicular to the line $x - y = 0$.

(v) **False**

Let $z = x + iy$, $z \neq 0$ and $\text{Re}(z) = 0$.

$$\text{i.e., } x = 0$$

$$\therefore z = iy$$

$$\text{Im}(z^2) = i^2 y^2 = -y^2 \neq 0$$

(vi) **True**

We have, $|z - 4| < |z - 2|$

Putting $z = x + iy$, we get

$$|x - 4 + iy| < |x - 2 + iy|$$

$$\Rightarrow \sqrt{(x - 4)^2 + y^2} < \sqrt{(x - 2)^2 + y^2}$$

$$\begin{aligned} \Rightarrow (x-4)^2 + y^2 &< (x-2)^2 + y^2 \\ \Rightarrow x^2 - 8x + 16 + y^2 &< x^2 - 4x + 4 + y^2 \\ \Rightarrow -8x + 16 &< -4x + 4 \\ \Rightarrow 4x &> 12 \\ \Rightarrow x &> 3 \end{aligned}$$

(vii) **False**

$$\begin{aligned} |z_1 + z_2| &= |z_1| + |z_2| \\ \Rightarrow |z_1 + z_2|^2 &= |z_1|^2 + |z_2|^2 + 2|z_1||z_2| \\ \Rightarrow |z_1|^2 + |z_2|^2 + 2\operatorname{Re}(z_1\bar{z}_2) &= |z_1|^2 + |z_2|^2 + 2|z_1||z_2| \\ \Rightarrow 2\operatorname{Re}(z_1\bar{z}_2) &= 2|z_1||z_2| \quad \Rightarrow \cos(\theta_1 - \theta_2) = 1 \\ \Rightarrow \theta_1 - \theta_2 &= 0 \quad \Rightarrow \arg(z_1) - \arg(z_2) = 0 \end{aligned}$$

(viii) **False**

We know that, any real number is also a complex number.

Matching Column Type Questions

Q24. Match the statements of Column A and Column B.

Column A			Column B
(a)	The polar form of $i + \sqrt{3}$ is	(i)	Perpendicular bisector of segment joining $(-2, 0)$ and $(2, 0)$
(b)	The amplitude of $-1 + \sqrt{3}$ is	(ii)	On or outside the circle having centre at $(0, -4)$ and radius 3.
(c)	If $ z + 2 = z - 2 $, then locus of z is	(iii)	$2/3$
(d)	If $ z + 2i = z - 2i $, then locus of z is	(iv)	Perpendicular bisector of segment joining $(0, -2)$ and $(0, 2)$
(e)	Region represented by $ z + 4i \geq 3$ is	(v)	$2(\cos \pi/6 + i \sin \pi/6)$
(f)	Region represented by $ z + 4i \leq 3$ is	(vi)	On or inside the circle having centre $(-4, 0)$ and radius 3 units.
(g)	Conjugate of $1 + 2i/1 - i$ lies in	(vii)	First quadrant

(h) Reciprocal of $1 - i$ lies in

(viii) Third quadrant

Sol. (a) Given that, $z = i + \sqrt{3}$

$$\text{So, } |z| = |i + \sqrt{3}| = \sqrt{1^2 + (\sqrt{3})^2} = 2$$

Also, z lies in first quadrant.

$$\Rightarrow \arg(z) = \tan^{-1} \frac{1}{\sqrt{3}} = \frac{\pi}{6}$$

So, the polar form of z is $2 \left(\cos \frac{\pi}{6} + i \sin \frac{\pi}{6} \right)$.

(b) We have, $z = -1 + \sqrt{-3} = -1 + i\sqrt{3}$

Here z lies in second quadrant.

$$\Rightarrow \arg(z) = \text{amp}(z) = \pi - \tan^{-1} \left| \frac{\sqrt{3}}{-1} \right| = \pi - \tan^{-1} \sqrt{3} = \pi - \frac{\pi}{3} = \frac{2\pi}{3}$$

(c) Given that, $|z + 2| = |z - 2|$

$$\Rightarrow |x + 2 + iy| = |x - 2 + iy|$$

$$\Rightarrow (x + 2)^2 + y^2 = (x - 2)^2 + y^2 \Rightarrow x^2 + 4x + 4 = x^2 - 4x + 4$$

$$\Rightarrow 8x = 0 \quad \therefore x = 0$$

It is a straight line which is a perpendicular bisector of segment joining the points $(-2, 0)$ and $(2, 0)$.

(d) We have $|z + 2i| = |z - 2i|$

Putting $z = x + iy$, we get

$$\Rightarrow |x + i(y + 2)|^2 = |x + i(y - 2)|^2 \Rightarrow x^2 + (y + 2)^2 = x^2 + (y - 2)^2$$

$$\Rightarrow 4y = 0 \Rightarrow y = 0$$

It is a straight line, which is a perpendicular bisector of segment joining $(0, -2)$ and $(0, 2)$.

Alternative method:

We know that $|z_1 - z_2|$ = distance between z_1 and z_2

$$\text{Now, } |z + 2i| = |z - 2i|$$

$$\Rightarrow |z - (-2i)| = |z - 2i|$$

\Rightarrow Distance between z and $-2i$ = Distance between z and $2i$

Thus, z lies on the perpendicular bisector of the line segment joining $-2i$ and $2i$.

Hence, z lies on the x -axis as shown in the figure.

(e) Given that, $|z + 4i| \geq 3$

$$\begin{aligned} \Rightarrow |x + iy + 4i| &\geq 3 & \Rightarrow |x + i(y + 4)| &\geq 3 \\ \Rightarrow \sqrt{x^2 + (y + 4)^2} &\geq 3 & \Rightarrow x^2 + y^2 + 8y + 16 &\geq 9 \\ \Rightarrow x^2 + y^2 + 8y + 7 &\geq 0 \end{aligned}$$

This represents the region on or outside the circle having centre $(0, -4)$ and radius 3.

(f) Given that, $|z + 4| \leq 3$

$$\begin{aligned} \Rightarrow |x + iy + 4| &\leq 3 & \Rightarrow |x + 4 + iy| &\leq 3 \\ \Rightarrow \sqrt{(x + 4)^2 + y^2} &\leq 3 & \Rightarrow (x + 4)^2 + y^2 &\leq 9 \\ \Rightarrow x^2 + 8x + 16 + y^2 &\leq 9 & \Rightarrow x^2 + 8x + y^2 + 7 &\leq 0 \end{aligned}$$

This represents the region on or inside circle having centre $(-4, 0)$ and radius 3.

$$\begin{aligned} \text{(g) } z &= \frac{1 + 2i}{1 - i} = \frac{(1 + 2i)(1 + i)}{(1 + i)(1 + i)} = \frac{1 + 2i + i + 2i^2}{1 - i^2} \\ &= \frac{1 - 2 + 3i}{1 + 1} = \frac{-1 + 3i}{2} \end{aligned}$$

Hence, \bar{z} lies in the third quadrant.

(h) Given that, $z = 1 - i$

$$\Rightarrow \frac{1}{z} = \frac{1}{1 - i} = \frac{1 + i}{(1 - i)(1 + i)} = \frac{1 + i}{1 - i^2} = \frac{1 + i}{2}$$

Thus, reciprocal of z lies in first quadrant.

Q28. What is the conjugate of $2-i / (1 - 2i)^2$

Sol. We have $z = \frac{2-i}{(1-2i)^2}$

$$\begin{aligned} \Rightarrow z &= \frac{2-i}{1+4i^2-4i} = \frac{2-i}{1-4-4i} = \frac{2-i}{-3-4i} \\ &= \frac{(2-i)}{-(3+4i)} = -\left[\frac{(2-i)(3-4i)}{(3+4i)(3-4i)} \right] \\ &= -\left(\frac{6-8i-3i+4i^2}{9+16} \right) = -\frac{(-11i+2)}{25} \\ &= \frac{-1}{25}(2-11i) = \frac{1}{25}(-2+11i) \end{aligned}$$

$$\therefore \bar{z} = \frac{1}{25}(-2-11i) = \frac{-2}{25} - \frac{11}{25}i$$

Q29. If $|Z_1| = |Z_2|$, is it necessary that $Z_1 = Z_2$?

Sol: If $|Z_1| = |Z_2|$ then z_1 and z_2 are at the same distance from origin.

But if $\arg(Z_1) \neq \arg(z_2)$, then z_1 and z_2 are different.

So, if $|z_1| = |z_2|$, then it is not necessary that $z_1 = z_2$.

Consider $Z_1 = 3 + 4i$ and $Z_2 = 4 + 3i$

Q30. If $(a^2+1)^2 / 2a - i = x + iy$, then what is the value of $x^2 + y^2$?

Sol: $(a^2+1)^2 / 2a - i = x + iy$

$$\Rightarrow \left| \frac{(a^2+1)^2}{2a-i} \right| = |x+iy|$$

$$\Rightarrow \frac{|(a^2+1)^2|}{|2a-i|} = |x+iy| \Rightarrow \frac{(a^2+1)^2}{\sqrt{(2a)^2+(-1)^2}} = \sqrt{x^2+y^2}$$

$$\therefore x^2+y^2 = \frac{(a^2+1)^4}{4a^2+1}$$

Q31. Find the value of z , if $|z| = 4$ and $\arg(z) = 5\pi/6$

Sol. Let $z = |z| (\cos \theta + i \sin \theta)$, where $\theta = \arg(z)$.

Given that, $|z| = 4$ and $\arg(z) = \frac{5\pi}{6}$.

$$\begin{aligned}\Rightarrow z &= 4 \left[\cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6} \right] && (z \text{ lies in II quadrant}) \\ &= 4 \left[-\frac{\sqrt{3}}{2} + i \frac{1}{2} \right] = -2\sqrt{3} + 2i\end{aligned}$$

32. Find the value of $\left| (1+i) \frac{(2+i)}{(3+i)} \right|$.

$$\text{Sol. } \left| (1+i) \frac{(2+i)}{(3+i)} \right| = |1+i| \frac{|2+i|}{|3+i|} = \sqrt{1^2+1^2} \frac{\sqrt{2^2+1^2}}{\sqrt{3^2+1^2}} = \sqrt{2} \frac{\sqrt{5}}{\sqrt{10}} = 1$$

33. Find the principal argument of $(1 + i\sqrt{3})^2$.

Sol. We have,

$$z = (1 + i\sqrt{3})^2 = 1 - 3 + 2i\sqrt{3} = -2 + i(2\sqrt{3})$$

So, z lies in second quadrant.

$$\Rightarrow \arg(z) = \pi - \tan^{-1} \left| \frac{2\sqrt{3}}{-2} \right| = \pi - \tan^{-1} \sqrt{3} = \pi - \frac{\pi}{3} = \frac{2\pi}{3}$$

Q34. Where does z lie, if $\left| \frac{z - 5i}{z + 5i} \right| = 1$?

Sol: We have $\left| \frac{z - 5i}{z + 5i} \right|$

$$\begin{aligned} \Rightarrow |z - 5i| &= |z + 5i| \quad \Rightarrow |x + iy - 5i| = |x + iy + 5i| \\ \Rightarrow |x + i(y - 5)|^2 &= |x + i(y + 5)|^2 \quad \Rightarrow x^2 + (y - 5)^2 = x^2 + (y + 5)^2 \\ \Rightarrow 20y &= 0 \quad \Rightarrow y = 0 \end{aligned}$$

So, z lies on the x -axis (real axis).

Alternative method:

We know that $|z_1 - z_2|$ = Distance between z_1 and z_2

$$\text{Now, } \left| \frac{z - 5i}{z + 5i} \right| = 1$$

$$\begin{aligned} \Rightarrow |z - 5i| &= |z + 5i| \quad \Rightarrow |z - 5i| = |z - (-5i)| \\ \Rightarrow \text{Distance between 'z' and '5i'} &= \text{Distance between 'z' and '-5i'} \end{aligned}$$

This means that z lies on the perpendicular bisector of the line segment joining ' $5i$ ' and ' $-5i$ '.

Hence, z lies on the x -axis as shown in the figure.

Instruction for Exercises 35-40: Choose the correct answer from the given four options indicated against each of the Exercises.

Q35. $\sin x + i \cos 2x$ and $\cos x - i \sin 2x$ are conjugate to each other for

(a) $x = n\pi$

(b) $x = \left(n + \frac{1}{2}\right)\frac{\pi}{2}$

(c) $x = 0$

(d) no value of x

Sol. (d) Given that,

$\sin x + i \cos 2x$ and $\cos x - i \sin 2x$ are conjugate to each other

$$\Rightarrow \overline{\sin x + i \cos 2x} = \cos x - i \sin 2x$$

$$\Rightarrow \sin x - i \cos 2x = \cos x - i \sin 2x$$

On comparing real and imaginary parts of both the sides, we get

$$\sin x = \cos x \text{ and } \cos 2x = \sin 2x$$

$$\Rightarrow \tan x = 1 \text{ and } \tan 2x = 1$$

Now, $\tan 2x = 1$

$$\Rightarrow \frac{2 \tan x}{1 - \tan^2 x} = 1, \text{ which is not satisfied by } \tan x = 1$$

Hence, no value of x is possible.

36. The real value of α for which the expression $\frac{1 - i \sin \alpha}{1 + 2i \sin \alpha}$ is purely real is

(a) $(n+1)\frac{\pi}{2}$

(b) $(2n+1)\frac{\pi}{2}$

(c) $n\pi$

(d) none of these

Sol. (c) $z = \frac{1 - i \sin \alpha}{1 + 2i \sin \alpha}$

$$= \frac{(1 - i \sin \alpha)(1 - 2i \sin \alpha)}{(1 + 2i \sin \alpha)(1 - 2i \sin \alpha)} = \frac{1 - i \sin \alpha - 2i \sin \alpha + 2i^2 \sin^2 \alpha}{1 - 4i^2 \sin^2 \alpha}$$

$$= \frac{1 - 3i \sin \alpha - 2 \sin^2 \alpha}{1 + 4 \sin^2 \alpha} = \frac{1 - 2 \sin^2 \alpha}{1 + 4 \sin^2 \alpha} - \frac{3i \sin \alpha}{1 + 4 \sin^2 \alpha}$$

It is given that z is a purely real.

$$\Rightarrow \frac{-3 \sin \alpha}{1 + 4 \sin^2 \alpha} = 0 \quad \Rightarrow -3 \sin \alpha = 0 \quad \Rightarrow \sin \alpha = 0$$

$$\Rightarrow \alpha = n\pi, n \in I$$

37. If $z = x + iy$ lies in the third quadrant, then $\frac{\bar{z}}{z}$ also lies in the third quadrant, if

(a) $x > y > 0$

(b) $x < y < 0$

(c) $y < x < 0$

(d) $y > x > 0$

Sol. (c) Since $z = x + iy$ lies in the third quadrant, we get

$$x < 0 \text{ and } y < 0$$

$$\text{Now, } \frac{\bar{z}}{z} = \frac{x - iy}{x + iy} = \frac{(x - iy)(x - iy)}{(x + iy)(x - iy)} = \frac{x^2 - y^2 - 2ixy}{x^2 + y^2} = \frac{x^2 - y^2}{x^2 + y^2} - \frac{2ixy}{x^2 + y^2}$$

Since $\frac{\bar{z}}{z}$ also lies in third quadrant, we get

$$\frac{x^2 - y^2}{x^2 + y^2} < 0 \text{ and } \frac{-2xy}{x^2 + y^2} < 0$$

$$\Rightarrow x^2 - y^2 < 0 \text{ and } -2xy < 0$$

$$\Rightarrow x^2 < y^2 \text{ and } xy > 0$$

But $x, y < 0$

$$\Rightarrow y < x < 0$$

38. The value of $(z + 3)(\bar{z} + 3)$ is equivalent to
 (a) $|z + 3|^2$ (b) $|z - 3|$ (c) $z^2 + 3$ (d) none of these

Sol. (a) Let $z = x + iy$. Then

$$\begin{aligned}(z + 3)(\bar{z} + 3) &= (x + iy + 3)(x - iy + 3) \\ &= (x + 3)^2 - (iy)^2 = (x + 3)^2 + y^2 = |x + 3 + iy|^2 = |z + 3|^2\end{aligned}$$

Alternative method:

$$\begin{aligned}(z + 3)(\bar{z} + 3) &= (z + 3)\overline{(z + 3)} \\ &= |z + 3|^2 \quad (\because z\bar{z} = |z|^2)\end{aligned}$$

39. If $\left(\frac{1+i}{1-i}\right)^x = 1$, then

- (a) $x = 2n + 1$ (b) $x = 4n$
 (c) $x = 2n$ (d) $x = 4n + 1$

where, $n \in N$

Sol. (b) $\left(\frac{1+i}{1-i}\right)^x = 1$

$$\Rightarrow \left[\frac{(1+i)(1+i)}{(1-i)(1+i)}\right]^x = 1 \Rightarrow \left[\frac{1+2i+i^2}{1-i^2}\right]^x = 1 \Rightarrow \left[\frac{2i}{1+1}\right]^x = 1$$

$$\Rightarrow i^x = 1$$

$$\Rightarrow x = 4n, n \in N$$

Q41. Which of the following is correct for any two complex numbers z_1 and z_2 ?

$$(a) |z_1 z_2| = |z_1| |z_2|$$

$$(b) \arg(z_1 z_2) = \arg(z_1) + \arg(z_2)$$

$$(c) |z_1 + z_2| \leq |z_1| + |z_2|$$

$$(d) |z_1 + z_2| \geq ||z_1| - |z_2||$$

Sol. (a) Clearly, $|z_1 z_2| = |z_1| |z_2|$

Proof:

$$\text{Let } z_1 = |z_1| (\cos \theta_1 + i \sin \theta_1) \text{ and } z_2 = |z_2| (\cos \theta_2 + i \sin \theta_2)$$

$$\begin{aligned} \text{Now, } z_1 z_2 &= |z_1| |z_2| (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2) \\ &= |z_1| |z_2| [\cos \theta_1 \cos \theta_2 + i \sin \theta_1 \cos \theta_2 + i \cos \theta_1 \sin \theta_2 \\ &\quad + i^2 \sin \theta_1 \sin \theta_2] \\ &= |z_1| |z_2| [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)] \end{aligned}$$

$$\Rightarrow |z_1 z_2| = |z_1| |z_2|$$

$$\text{And } \arg(z_1 z_2) = \theta_1 + \theta_2 = \arg(z_1) + \arg(z_2)$$

$|z_1 + z_2| = |z_1| + |z_2|$ is true only when z_1, z_2 and $O(\text{origin})$ are collinear.

$$\text{Also, } |z_1 + z_2| \geq ||z_1| - |z_2||$$
